ENGAGEMENT OVERVIEW

The AI Security Readiness Assessment

Find out exactly where you stand against AI-driven attacks — before someone else does.

Before we propose fully managed services, we begin every relationship with an **AI Security Readiness Assessment** — a focused, high-impact engagement that benchmarks how prepared your organization is for an AI-accelerated threat landscape. This is not a generic scan or a sales gimmick. It is a deep, professional investigation that scores your environment across six dimensions and shows you what attackers — and your cyber-insurance carrier — already know about your exposure.

The threat landscape changed faster than most defenses did.

The same AI that makes your teams faster also lets attackers craft flawless phishing, automate reconnaissance, and weaponize stolen credentials at machine speed. The decisive question is no longer whether your people will be targeted — it is whether your identity and network architecture can contain the attack that eventually succeeds.

Why We Do This First

You wouldn't trust a doctor who prescribes before diagnosing. We take the same stance with cybersecurity. Most organizations cannot confidently answer the questions that decide whether an incident becomes a minor event or a major loss. This assessment is designed to:

- Benchmark your security posture across six measurable dimensions — not a vague sense of unease.
- Expose where stolen credentials and unpatched software — the two largest entry points in today's breaches — leave you exposed.
- Reveal how far an attacker could move after a single compromise — your real blast radius.
- Evaluate user behavior against modern, AI-generated social-engineering tactics.
- Verify whether the cyber-insurance controls you attested to are genuinely in place today.

This is a **paid engagement**, because it delivers real value — not a glorified sales pitch. Should you choose to move forward with our full managed services, we credit the cost of the assessment toward your onboarding.

What We Look At: The Six Dimensions

Your AI Security Readiness Score is built across six dimensions. Each is investigated with the right mix of external scanning, internal agents, and live testing — then rated and prioritized in plain language.

Dimension	What We Measure	How
Identity Security	How well sign-ins and accounts are protected — including whether MFA is phishing-resistant or merely a bypassable code or push prompt.	External + Internal
Endpoint Security	How well laptops, desktops, and servers are hardened, patched, and free of exposed credentials and sensitive data.	Internal Agents
Network Segmentation	How far an attacker could move laterally after a single foothold — your blast radius.	Internal
Email & Collaboration Security	Configuration, sharing permissions, and exposure across Microsoft 365.	External + Internal
Backup & Recovery	Whether your backups are isolated from ransomware and whether a fast, tested restore is genuinely possible.	Internal
Incident Readiness	Whether you'd know what to do — and could prove it — when something happens.	Review + Interview

External Risk Scan

Using advanced tooling, we analyze your organization from the outside in — the same vantage point an attacker starts from:

- Domain, website, DNS, and SSL/TLS certificate posture
- Publicly exposed services and known vulnerabilities
- Breached credentials and data found on the dark web
- Public footprint that could fuel AI-assisted reconnaissance and pretexting

Internal Risk Assessment

With lightweight endpoint agents deployed across your devices, we safely measure what's really happening inside:

- Patch status, security configurations, and outdated software
- Exposed PII, saved passwords, and unprotected sensitive documents
- Endpoint hygiene, privilege sprawl, and standing administrative rights
- Lateral-movement potential and network segmentation gaps

Phishing & Social-Engineering Simulation

A real-world phishing test gauges how your team responds to modern, AI-generated social engineering — the personalized, error-free lures that bypass the old “look for typos” advice. People are often the weakest link, and this shows you exactly where coaching pays off.

A Quick Gut Check

Before we even begin, these six questions reveal a lot. Answer each honestly — yes, no, or “I don’t know.”

1. How many of your users have local administrator rights on their computers?
2. If you terminated an employee today, could they still access any company system tomorrow?
3. Are your backups isolated so that ransomware cannot reach and encrypt them?
4. Could your CEO or finance lead be convincingly impersonated with AI-generated audio or email?
5. Are your Microsoft 365 accounts protected by phishing-resistant MFA — not just a code or push prompt?
6. Would your cyber-insurance policy actually survive a claim audit of the controls you attested to?

If you answered “I don’t know” to more than two of these, your organization likely has meaningful cybersecurity exposure that has never been measured — and that is exactly the gap attackers and insurers both look for.

What You Receive: A Sample Scorecard

You get a clear benchmark, not a data dump. Below is an *illustrative* scorecard (sample ratings, not a real client) to show the format of your deliverable:

Dimension	Rating	Example Finding
Identity Security	At Risk	MFA present but bypassable; not phishing-resistant.
Endpoint Security	Needs Work	Patching inconsistent across the fleet.
Network Segmentation	At Risk	Flat network; one foothold reaches everything.
Email & Collaboration	Needs Work	Microsoft 365 sharing left at permissive defaults.
Backup & Recovery	Solid	Backups isolated; restore tested recently.
Incident Readiness	Needs Work	No written or tested response plan.

Your top three priorities, ranked: (1) make MFA phishing-resistant, (2) segment the network, (3) write and test an incident-response plan. Every finding maps to a prioritized, plain-language remediation step — most urgent first.

How the Engagement Works

- ✓ **Discovery.** We meet with your team to understand your business, systems, and goals.
- ✓ **Safe scanning.** We deploy lightweight agents and external tooling to safely measure real exposure.
- ✓ **Live testing.** We run a controlled phishing simulation against modern social-engineering tactics.
- ✓ **Scoring.** We rate your AI Security Readiness across all six dimensions.
- ✓ **Written report.** You receive clear evidence, prioritized business risks, and a ranked remediation roadmap.
- ✓ **Review call.** We walk through the findings together and answer your questions.

Timeline

The full assessment and delivery typically takes 1–2 weeks, depending on the size of your environment. We aim to schedule your review call within 14 days of kickoff.

What You Keep

You keep the executive summary and remediation roadmap **whether or not you ever become a client.** The clarity is yours either way.

The Outcome

Most organizations discover they've been unintentionally inviting risk — and attackers have already taken notice. This assessment replaces the discomfort of not knowing with a clear, prioritized plan written for leaders, not just for IT.

Whether you proceed with us or not, you'll walk away with the truth about your current security posture in an AI-accelerated world — and a partner ready to help you **turn that shift into an advantage.**
